

Big Ideas in Algebraic Thinking

Topic	Big Ideas	Examples
<p>Sets</p> 	<ul style="list-style-type: none"> • Attributes can be used to sort collections into sets. • The same collection can be sorted in different ways. • Sets can be compared and ordered. 	<ul style="list-style-type: none"> • Color, size, shape, type of object, etc. • Red bears vs. blue bears; big bears vs. little bears • <i>There are more red bears than blue bears (compare); small red bears—medium red bears—large red bears (order)</i>
<p>Pattern and Regularity</p> 	<ul style="list-style-type: none"> • Patterns are sequences (repeating or growing) governed by a rule and they exist both in the world and in mathematics. • Identifying a pattern brings predictability and allows one to make generalizations. • The same pattern can be found in many different forms. 	<ul style="list-style-type: none"> • Dots on a ladybug; posts of a fence; adding 1 to a number gives you the next number • <i>After lunch comes recess; If we keep counting people's feet, it will always be 2 more.</i> • Big block, little block; big block, little block; big block, little block; snap, clap; snap, clap; snap, clap
<p>Representation and Symbolism</p> 	<ul style="list-style-type: none"> • Mathematical ideas about quantities and relationships can be represented by symbols. • Mathematical problems can be more easily understood and solved through the use of mathematical modeling. • Change can be represented mathematically—both qualitatively and quantitatively. 	<ul style="list-style-type: none"> • Symbols can be objects, drawings, or written symbols like numbers and words. • <i>Marcus had 1 block and Felicia gave him 1 can be modeled with counters on a plate or as $1 + 1 = 2$.</i> • <i>Today is colder than yesterday (qualitative) vs. Today is 4° colder than yesterday (quantitative)</i>
<p>Relationships and Functions</p> 	<ul style="list-style-type: none"> • Quantitative comparisons can be represented mathematically through equations and inequalities. • The equal sign means quantities on either side of it are the same as one another – it does not mean “solve this problem” or “put the answer here.” • A function is a special relationship in which two sets are linked by a rule. 	<ul style="list-style-type: none"> • <i>The 7 inch tower is 2 inches taller than the 5 inch tower or $7 > 5$; If I give Sam 1 more he'll have 3 just like me or $2 + 1 = 3$.</i> • <i>Robbie has 3 bears and Jayden has 3 bears, so they have the same number of bears or $3 = 3$.</i> • The cost of train tickets is a function of the number of tickets: 1 ticket is \$2; 2 tickets are \$4; 3 tickets are \$6 and so on. ($n \times \\$2 = \text{cost}$)
